Subject: RE: Runway 15 Southerly SIDs PIR Progress Update

[REDACTED]

Following your email please find attached an updated slide pack which have been reordered as per your request and I have added the additional SID information for southerly departures.

With regards to your request for data relating to altitude attainment I am unsure as to exactly what you would be looking for and was wondering if you have any previous examples? All of the SIDs have a minimum altitude of 4,000 ft after approximately 13 nautical track miles. The images in the attached slide deck show that aircraft are achieving 4,000 ft well in advance of this distance which I hope will be sufficient?

I trust that the above and attached is satisfactory and please let me know if you have any further queries.

Kind regards
